Contents

Preface **xiii**

1. Models of Growth and Decay **1**

1.1. A Simple Pension and Annuity Plan **1**
1.2. Income Tax Bracket Creep and the Quiet Revolution of 1980 **8**
1.3. Retirement of a Mortgage **16**
1.4. Some Mathematical Descriptions of the Theory of Malthus **18**
1.5. Metastasis and Resistance **29**
Problems **37**
References **38**

2. Models of Competition, Survival, and Combat **39**

2.1. An Analysis of the Demographics of Ancient Israel **39**
2.2. The Plague and John Graunt's Life Table **44**
2.3. Modular Data–Based Wargaming **48**
2.3.1 Herman Kahn and the Winning of the Cold War **64**
2.4. Predation and Immune Response Systems **65**
2.5. Pyramid Clubs for Fun and Profit **69**
Problems **72**
References **74**

3. Epidemics **75**

3.1. Introduction **75**
3.2. John Snow and the London Cholera Epidemic of 1854 **77**
3.3. Prelude: The Postwar Polio Epidemic **79**
3.4. AIDS: A New Epidemic for America **80**
3.5. Why an AIDS Epidemic in America? **82**
3.5.1 Political Correctness Can Kill **84**
3.6. The Effect of the Gay Bathhouses **85**
3.7. A More Detailed Look at the Model **88**
3.8. Forays into the Public Policy Arena **91**
3.9. Modeling the Mature Epidemic **92**
3.10. AIDS as a Facilitator of Other Epidemics **95**
3.11. Comparisons with First World Countries **95**

3.12. Conclusions: A Modeler's Portfolio **103**
Problems **106**
References **109**

4. Bootstrapping **111**

4.1. Introduction **111**
4.2. Bootstrapping Analysis of Darwin's Data **112**
4.3. A Bootstrapping Approximation to Fisher's Nonparametric Test **116**
4.4. A Resampling Bassed Sign Test **119**
4.5. A Bootstrapping Approach for Confidence Intervals **121**
4.6. Solving Ill-Structured Problems **122**
Problems **128**
References **130**

5. Monte Carlo Solutions of Differential Equations **131**

5.1. Introduction **131**
5.2. Gambler's Ruin **134**
5.3. Solution of Simple Differential Equations **137**
5.4. Solution of the Fokker−Planck Equation **138**
5.5. The Dirichlet Problem **139**
5.6. Solution of General Elliptic Differential Equations **142**
5.7. Conclusions **144**
Problems **145**
References **146**

6. SIMEST, SIMDAT, and Pseudoreality **147**

6.1. Introduction **147**
6.2. The Bootstrap: A Dirac−Comb Density Estimator **149**
6.3. SIMDAT: A Smooth Resampling Algorithm **152**
6.3.1. The SIMDAT Algorithm **153**
6.3.2. An Empirical Justification of SIMDAT **153**
6.4. SIMEST: An Oncological Example **156**
6.4.1 An Exploratory Prelude **158**
6.4.2 Models and Algorithms **158**
Problems **170**
References **172**

7. Exploratory Data Analysis **175**

7.1. Introduction **175**
7.2. Smoothing **176**
7.3. The Stem and Leaf Plot **187**

7.4. The Five Figure Summary **188**
7.5. Tukey's Box Plot **189**
Problems **192**
References **192**

8. Noise Killing Chaos **193**

8.1. Introduction **193**
8.2. The Discrete Logistic Model **196**
8.3. A Chaotic Convection Model **201**
8.4. Conclusions **204**
Problems **208**
References **208**

9. A Primer in Bayesian Data Analysis **209**

9.1. Introduction **209**
9.2. The EM Algorithm **210**
9.3. The Data Augmentation Algorithm **213**
9.4. The Gibbs Sampler **219**
9.5. Conclusions **224**
Problems **225**
References **228**

10. Multivariate and Robust Procedures in Statistical Process Control **229**

10.1. Introduction **229**
10.2. A Contamination Model for SPC **231**
10.3. A Compound Test for Higher Dimensional SPC Data **236**
10.4. Rank Testing with Higher Dimensional SPC Data **239**
10.5. A Robust Estimation Procedure for Location in Higher Dimensions **243**
Problems **246**
References **248**

11. Considerations for Optimization and Estimation in the Real (Noisy) World **249**

11.1. Introduction **249**
11.2. The Nelder−Mead Algorithm **253**
11.3. The Box−Hunter Algorithm **256**
11.4. Simulated Annealing **262**
11.5. Exploration and Estimation in High Dimensions **264**
Problems **270**
References **271**

12. Utility and Group Preference **273**

12.1. Introduction **273**

12.2. The St. Petersburg Paradox **274**
12.3. von Neumann−Morgenstern Utility **282**
12.4. Creating a St. Petersburg Trust **287**
12.5. Some Problems with Aggregate Choice Behavior **290**
12.6. Jeffersonian Realities **293**
12.7. Conclusions **300**
Problems **300**
References **303**

13. A Primer in Sampling **305**

13.1. Introduction **305**
13.1.1. Tracking Polls **308**
13.2. Stratification **309**
13.2.1. A Warehouse Inventory **311**
13.3. The Saga of Happy Valley **312**
13.3.1 The Problem with Standards **313**
13.4. To Annex or Not **316**
13.4.1. The Bootstrap: The World in a Drop of Water **316**
13.4.2. Resampling and Histograms 317
13.5. Using Sampling to Estimate Total Population Size 321
13.5.1. Capture Recapture 322
Problems 324
References 325

14. Stock Market: Strategies Based on Data versus Strategies Based on Ideology 327

14.1. Introduction 327
14.2. Markowitz's Efficient Frontier: Portfolio Design as Constrained Optimization 329
14.3. Sharpe's Super Efficient Frontier: the Capital Market Line (CAPM) 333
14.4. The Security Market Line 335
14.5. The Sharpe Diagonal Model 337
14.6. Portfolio Evaluation and the Capital Asset Pricing Model 339
14.7. Views of Risk 342
14.7.1. Diversification 344
14.8. Stock Progression as Geometric Brownian Motion 344
14.8.1. Ito's Lemma 344
14.8.2. A Geometric Brownian Model for Stocks 346
14.9. Estimating μ and □ 346
14.10. The Time Indexed Distribution of Portfolio Value 348
14.11. Negatively Correlated Portfolios 351
14.12. Bear Jumps 354
14.13. "Everyman's" MaxMedian Rule for Portfolio Manangement 357
14.13.1 Investing in a 401k 360
14.14. Derivatives 363
14.14.1. Black−Scholes and the Search for Risk Neutrality 364

14.14.2. A Game Independent of the Odds 365
14.14.3. The Black−Scholes Hedge Using Binomial Trees 368
14.15. The Black−Scholes Derivation Using Differential Equations 374
14.16. Black−Scholes: Some Limiting Cases 376
14.17. Conclusions 381
Problems 382
References 384

Appendix A. A Brief Introduction to Probability and Statistics 387
A.1. Craps An Intuitive Introduction to Probability and Statistics 387
A.1.1. Random Variables, Their Means and Variances 387
A.2. Combinatorics Basics 393
A.3. Bayesian Statistics 394
A.3.1. Bayes' Theorem 394
A.3.2. A Diagnostic Example 396
A.4. The Binomial Distribution 397
A.5. The Uniform Distribution 399
A.6. Moment Generating Functions 401
A.7. The Normal (Gaussian) Distribution 402
A.8. The Central Limit Theorem 405
A.9. The Gamma Distribution 406
A.10. Conditional Density Functions 407
A.11. The Weak Law of Large Numbers 409
A.12. The Multivariate Normal Distribution 411
A.13. The Wiener Process 411
A.14. The Poisson Process and the Poisson Distribution 412
A.14.1. Simulating Bear Jumps 414
A.15. Parametric Simulation 415
A.15.1. Simulating a Geometric Brownian Walk 416
A.15.1. The Multivariate Case 417
A.16. Resampling Simulation 420
A.16.1. The Multivariate Case 421
A.17. A Portfolio Case Study 422

Appendix B. Statistical Tables 425
Tables of the Normal Distribution 425
Tables of the Chi-Square Distribution 426

Index 427
